Project 2 — Word Ladders
Due date: Friday, November 18, 2022

Goal

Develop and implement a word ladder finder.

Details

A word ladder (*aka* doublet) is a type of puzzle created by Charles Dodgson (*aka* Lewis Carroll) in the 1800s. The premise of the puzzle is to "convert" one word into the other by a sequence of single-letter changes, with each change generating a valid English word. For example, you can change *beer* into *wine* via the sequence *beer – beet – bent – lent – lint – line – wine*. There may be other ladders for these words as well.

Your program should begin by reading words from the file `sgb-words.txt`; the file consists of 5 757 words used to test the Stanford GraphBase. Note that all words have exactly five letters.

Each word should have two values connected to it:

- A pointer to a word (and its connected data)
  Pro tip: You can use an integer index instead of a pointer. Use −1 for **NULL** or `nullptr`.

- A linear list of pointers to other words

Initialize the pointer for each word to **NULL**. Then, examine each pair of words — there are 16 568 646 such pairs. If the pair has a *Hamming distance* of 1, then add each word — a pointer to the word, actually — to the other word's list.

Read two five-letter words from the keyboard. Find both words in the word list. If either word is not in the list, stop and output that no word ladder exists. Otherwise, do the following algorithm.

Algorithm 1 Generating a word ladder

Preconditions w_1 and w_2 are words in the word list

Postconditions A shortest word ladder from w_1 to w_2 is displayed if one exists

```
 1:  procedure GENLADDER(w₁,w₂)
 2:      Add w₂ to a queue Q

 3:      while Q is not empty do
 4:          Dequeue Q into w

 5:          for each word v in w.list do
 6:              if v.ptr = NULL and v ≠ w₂ then
 7:                  v.ptr ← w
 8:                  Enqueue v in Q
 9:              end if
10:          end for
11:      end while

12:      if w₁.ptr ≠ NULL then
13:          output  w₁
14:          w ← w₁.ptr

15:          while w ≠ NULL do
16:              output  w
17:              w ← w.ptr
18:          end while
19:      else
20:          no ladder exists
21:      end if
22:  end procedure
```

What to turn in

Turn in your source code and **Makefile**. If you are using an IDE, compress the folder containing the project and submit that.

Example 1

▸*Input*
```
while loops
```

▸*Output*
```
Ladder:
while
whine
chine
chins
coins
loins
loons
loops
```

Example 2

▸*Input*
```
zzzzz yyyyy
```

▸*Output*
```
Error: first word not in list
```

Example 3

▸*Input*
```
books zzzzz
```

▸*Output*
```
Error: second word not in list
```

Example 4

▸*Input*
```
there their
```

▸*Output*
```
No ladder exists
```
